

TRATAMIENTO CONJUNTO ENDODONCISTA + REHABILITADOR

OBJETIVOS

- ✓ Convertir al tratamiento endodóntico e inserción del anclaje radicular en un procedimiento continuo y único
- ✓ Reducir riesgos de contaminación
- ✓ Menor trauma para el diente
- ✓ Evitar el desgaste innecesario de tejido dentario
- ✓ No obturar los túbulos de la dentina del lecho para el poste con cemento endodóntico (se podría conseguir verdadera adhesión con “tags” de resina)
- ✓ Reducción de sesiones de trabajo

CECILIA

DÍA 1

1. Inserción de pernos en 1.1
2. Remoción de corona de 2.1
3. Tallados
4. Provisionales

DÍA 1

Secuencia de instrumentación

1. Gates #1 (0.5 mm)
2. Peeso #2 (0.7 mm - cilíndrica)
3. Fresa Macro-Lock (0.8 mm - cónica)
4. Fresa Macro-Lock (0.8 mm - cónica)
5. Fresa Macro-Lock (1.0 mm - cónica)

DÍA 2

1. Remoción de provisionales
2. Remoción de perno metálico de 2.1
3. Retratamiento endodóntico de 2.1
4. Inserción de perno de fibra modificado con FRC en 2.1
5. Confección de nuevos provisionales

MICO AW 81

El **1,2,3-propanotriol**, **glicerol** o **glicerina** ($C_3H_8O_3$) (del griego *glykos*, dulce) es un alcohol con tres grupos hidroxilos(-OH). Se trata de uno de los principales productos de la degradación digestiva de los lípidos, paso previo para el ciclo de Krebs y también aparece como un producto intermedio de la fermentación alcohólica. Además junto con los ácidos grasos, es uno de los componentes de lípidos como los triglicéridos y los fosfolípidos. Se presenta en forma de líquido a una temperatura ambiental de 25 ° C y es higroscópico e inodoro. Posee un coeficiente de viscosidad alto y tiene un sabor dulce como otros polialcoholes.
